

LeafFit: Plant-Asset Creation from 3D Gaussian Splatting

Chang Luo Umetani Nobuyuki

The University of Tokyo

Converting 3DGS-captured Plant to Asset-ready Mesh

Input: 3DGS

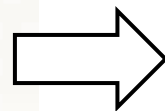

Output: Mesh

Implicit method's output are heavy

3DGS Captured Plant

Output Mesh

Estimate Geodesic Distance Fields

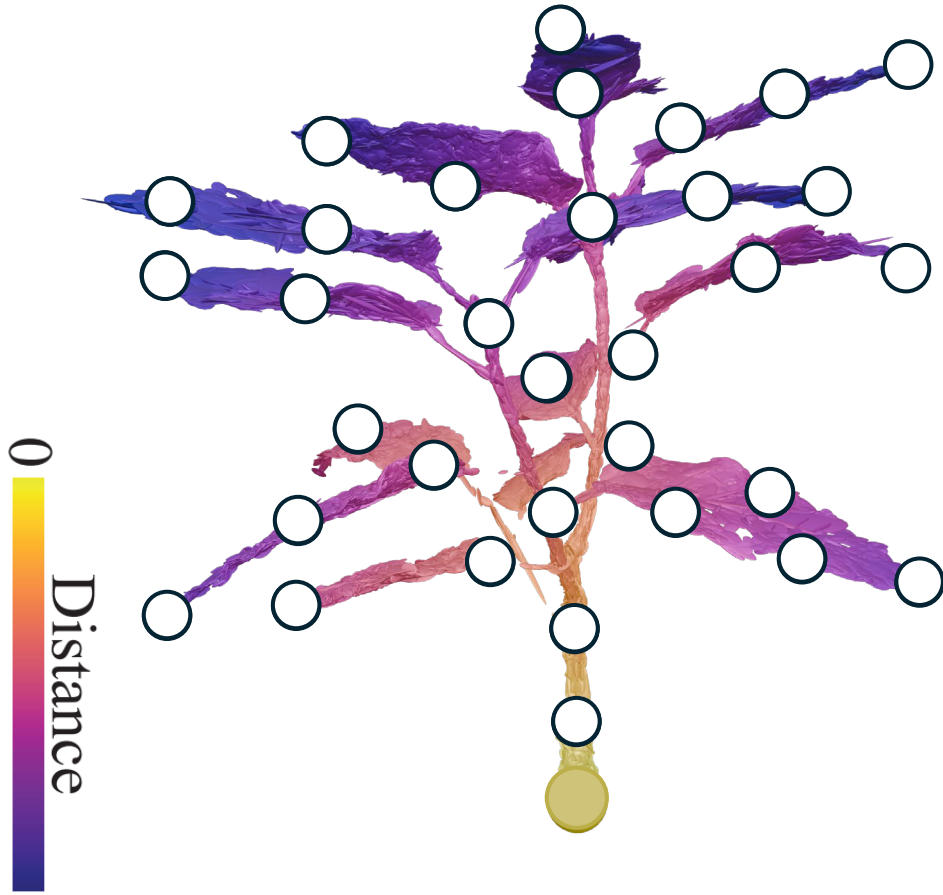

Down-sample

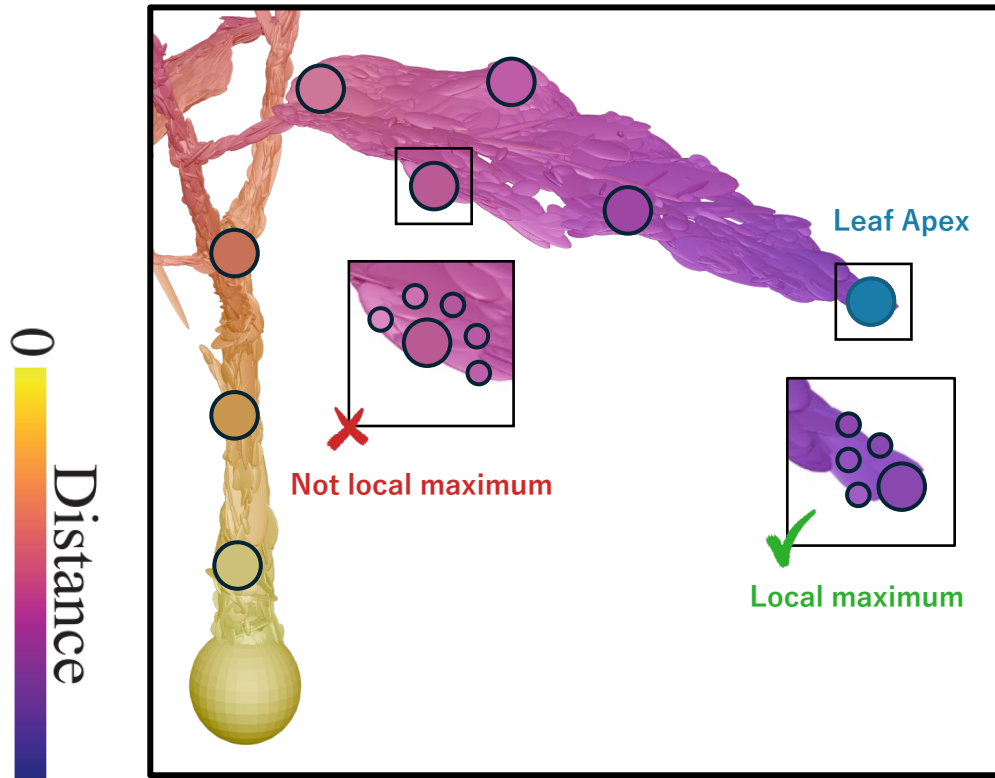

- Get sparse points ○ by down-sampling

Measure distance to root

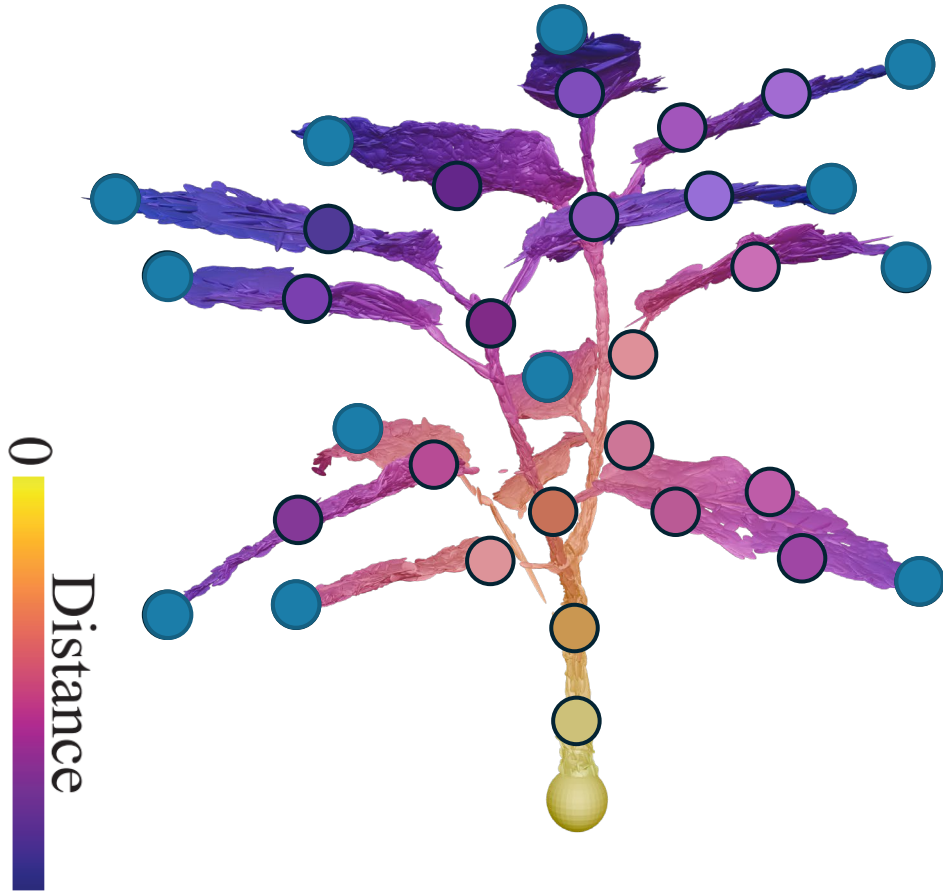

- Get sparse points $\bigcirc$ by down-sampling
- Get the geodesic distance to **root** $\bullet$

Determine leaf apexes

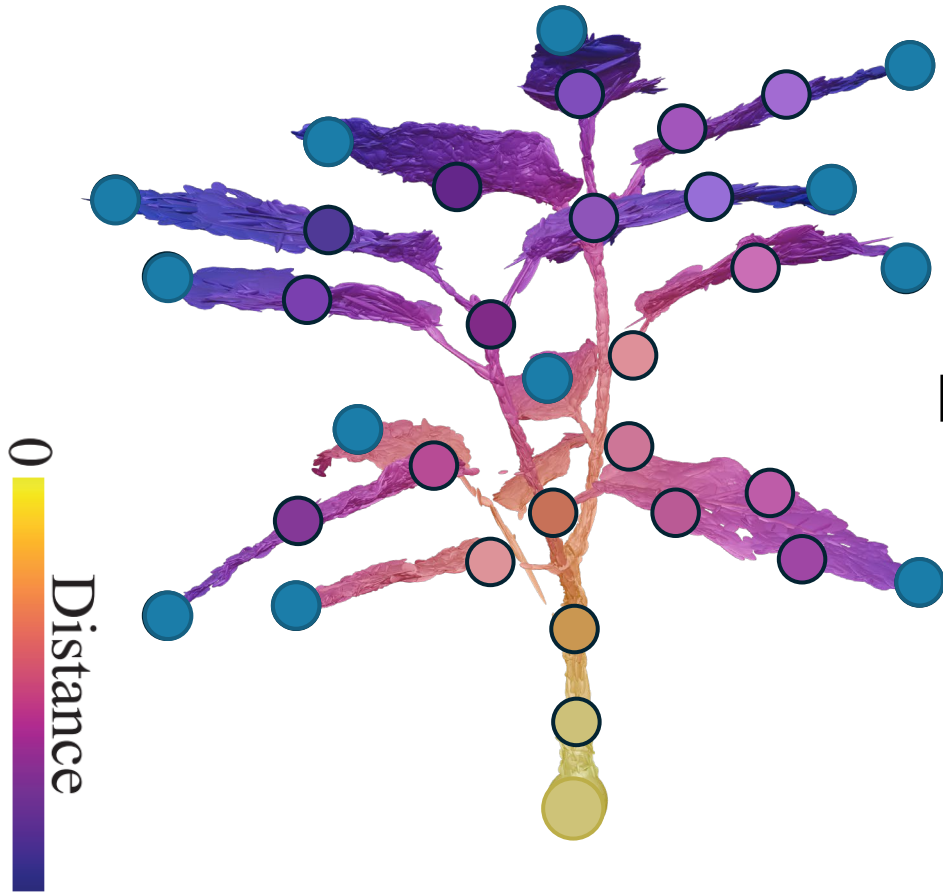

- Get sparse points ○ by down-sampling
- Get the geodesic distance to **root** ●
- Check neighbors to find leaf apexes ●

Determine leaf apexes

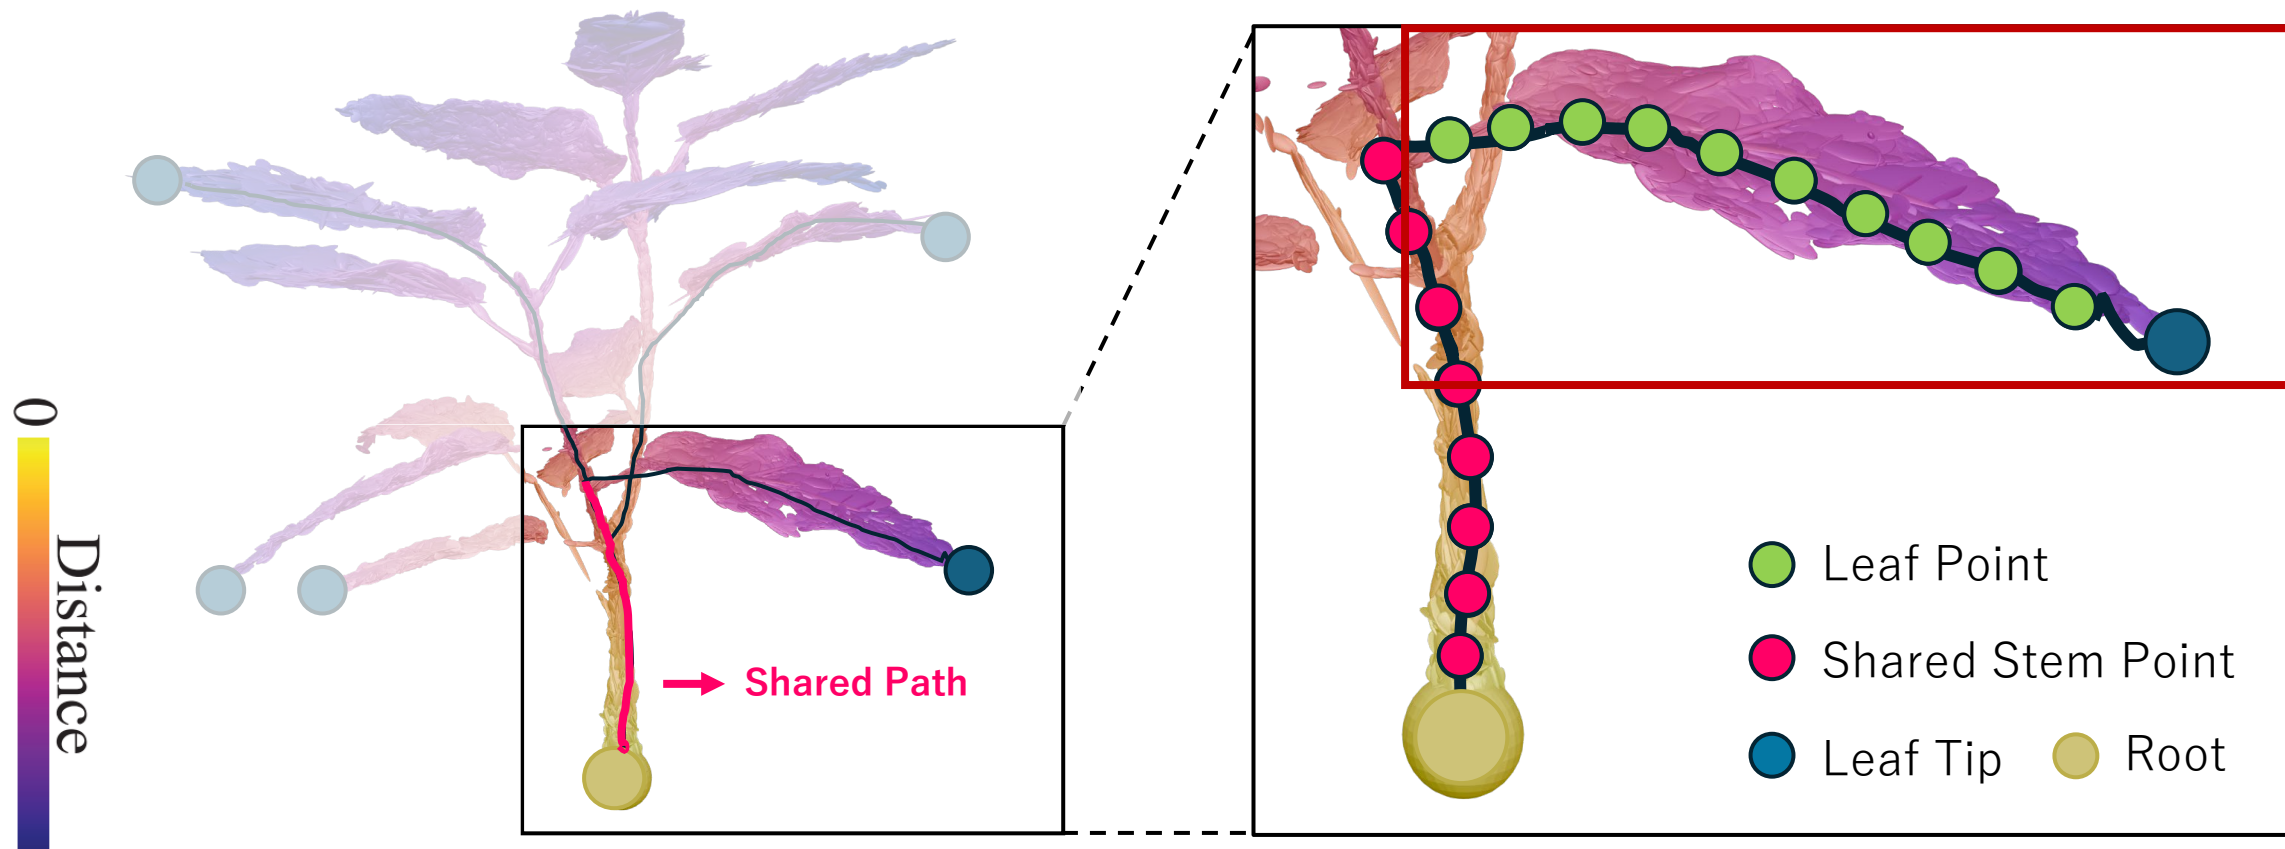

- Get sparse points ○ by down-sampling
- Get the geodesic distance to **root** ●
- Check neighbors to find **leaf apexes** ●

Get Apex-Root pathes

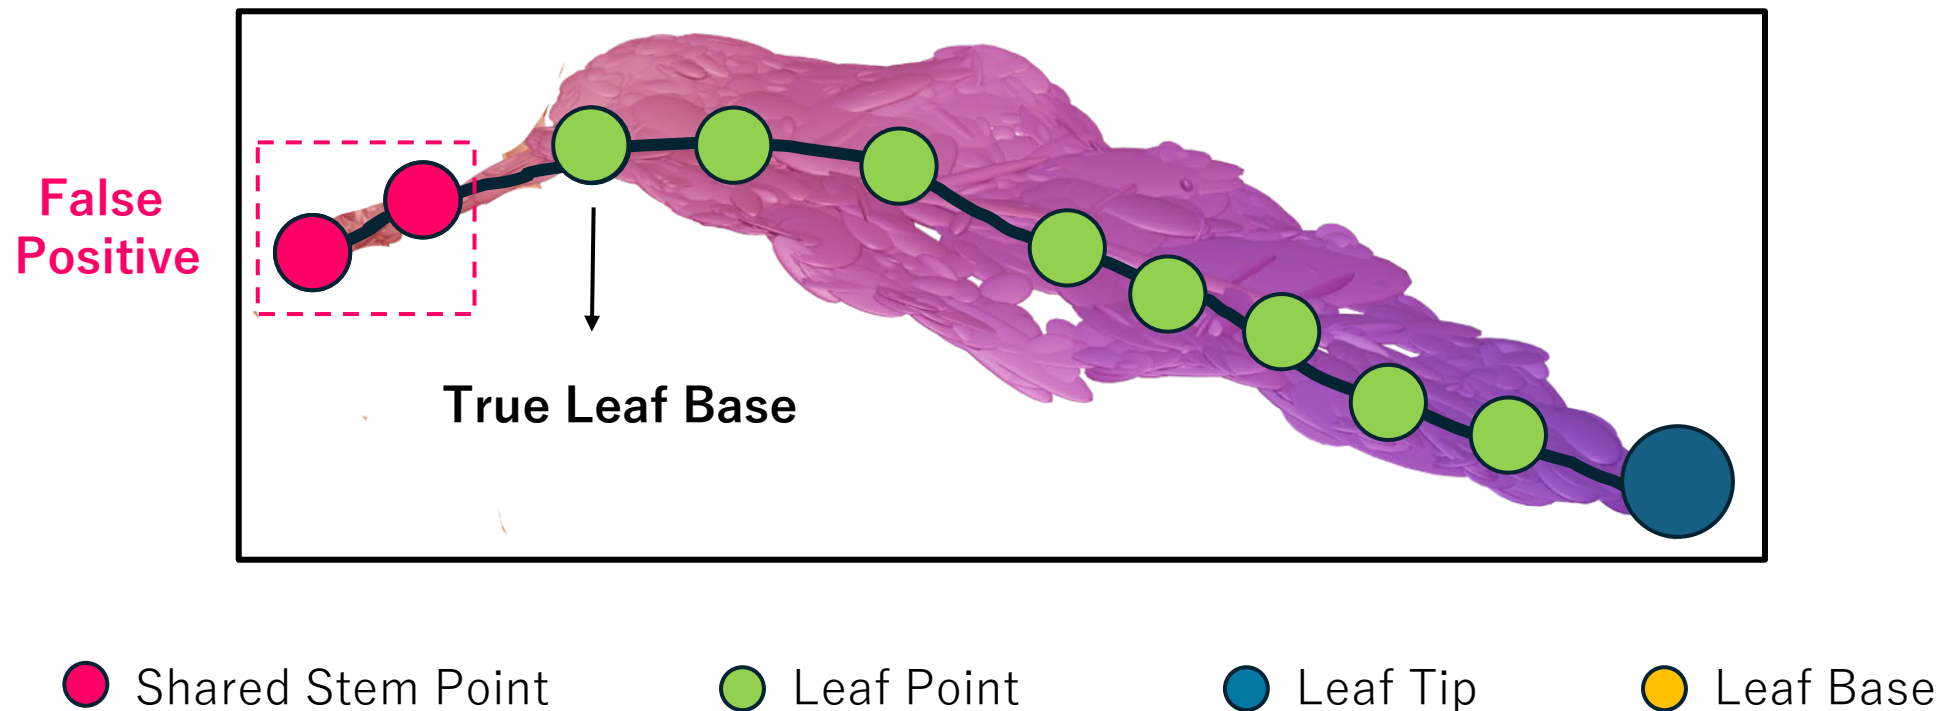

- Get sparse points $\bigcirc$ by down-sampling
- Get the geodesic distance to **root** $\bigcirc$
- Check neighbors to find **leaf apexes** $\bullet$
- Get the paths from **apexes** $\bullet$ to **root** $\bigcirc$

Leaf-stem Segmentation

Leaf-stem Segmentation

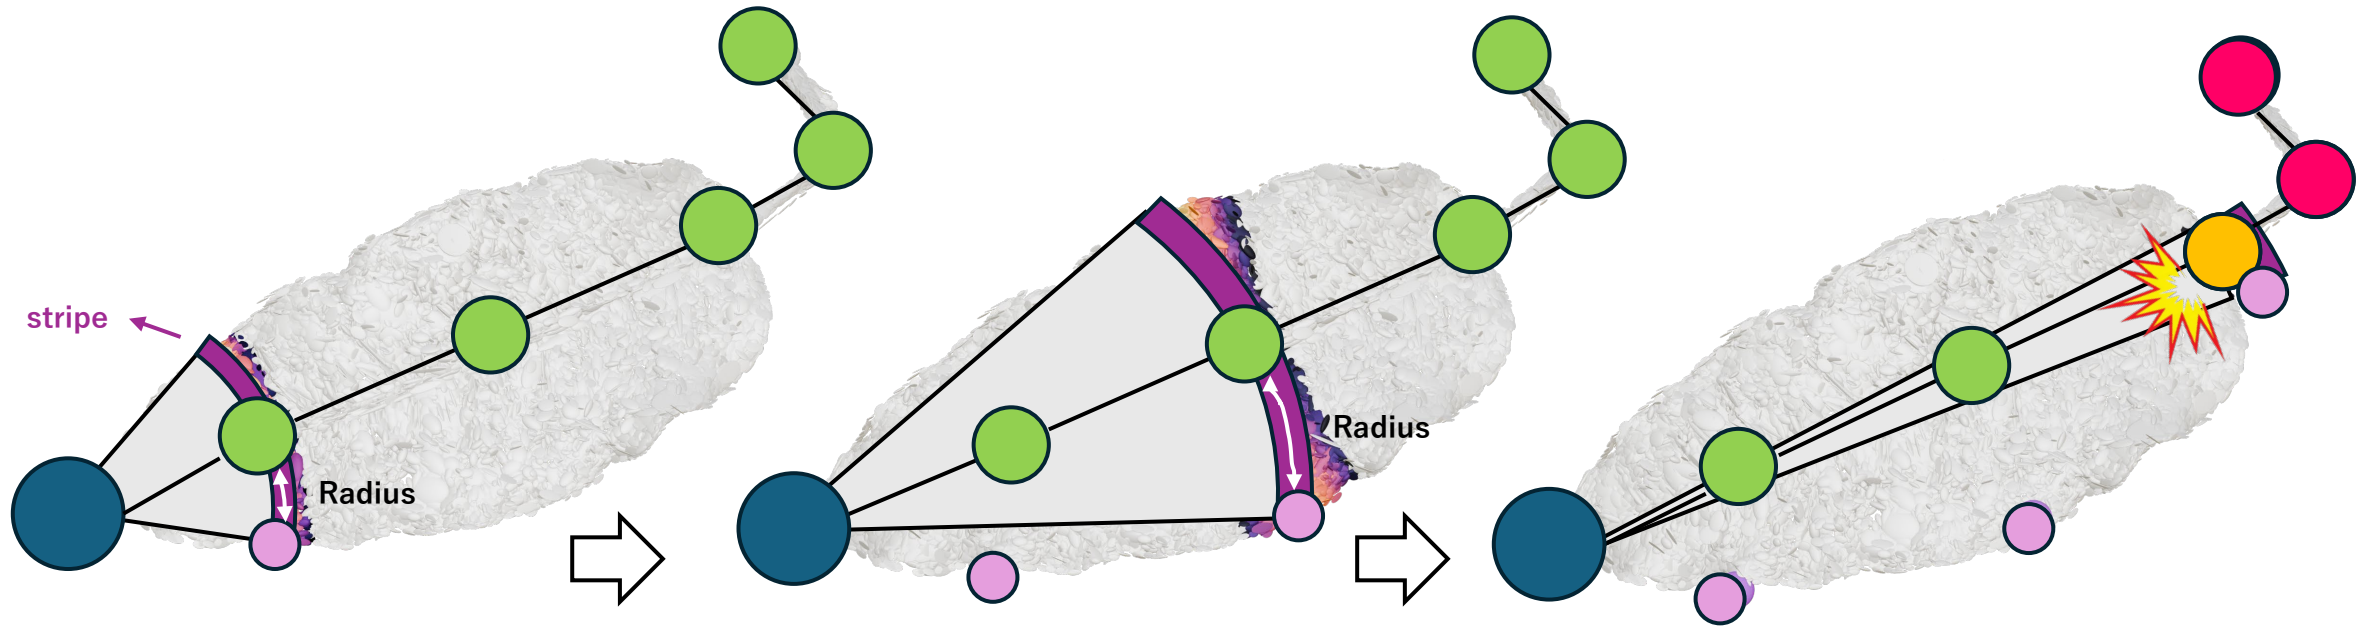

Some points are misclassified as **leaf points**.

Find real leaf base

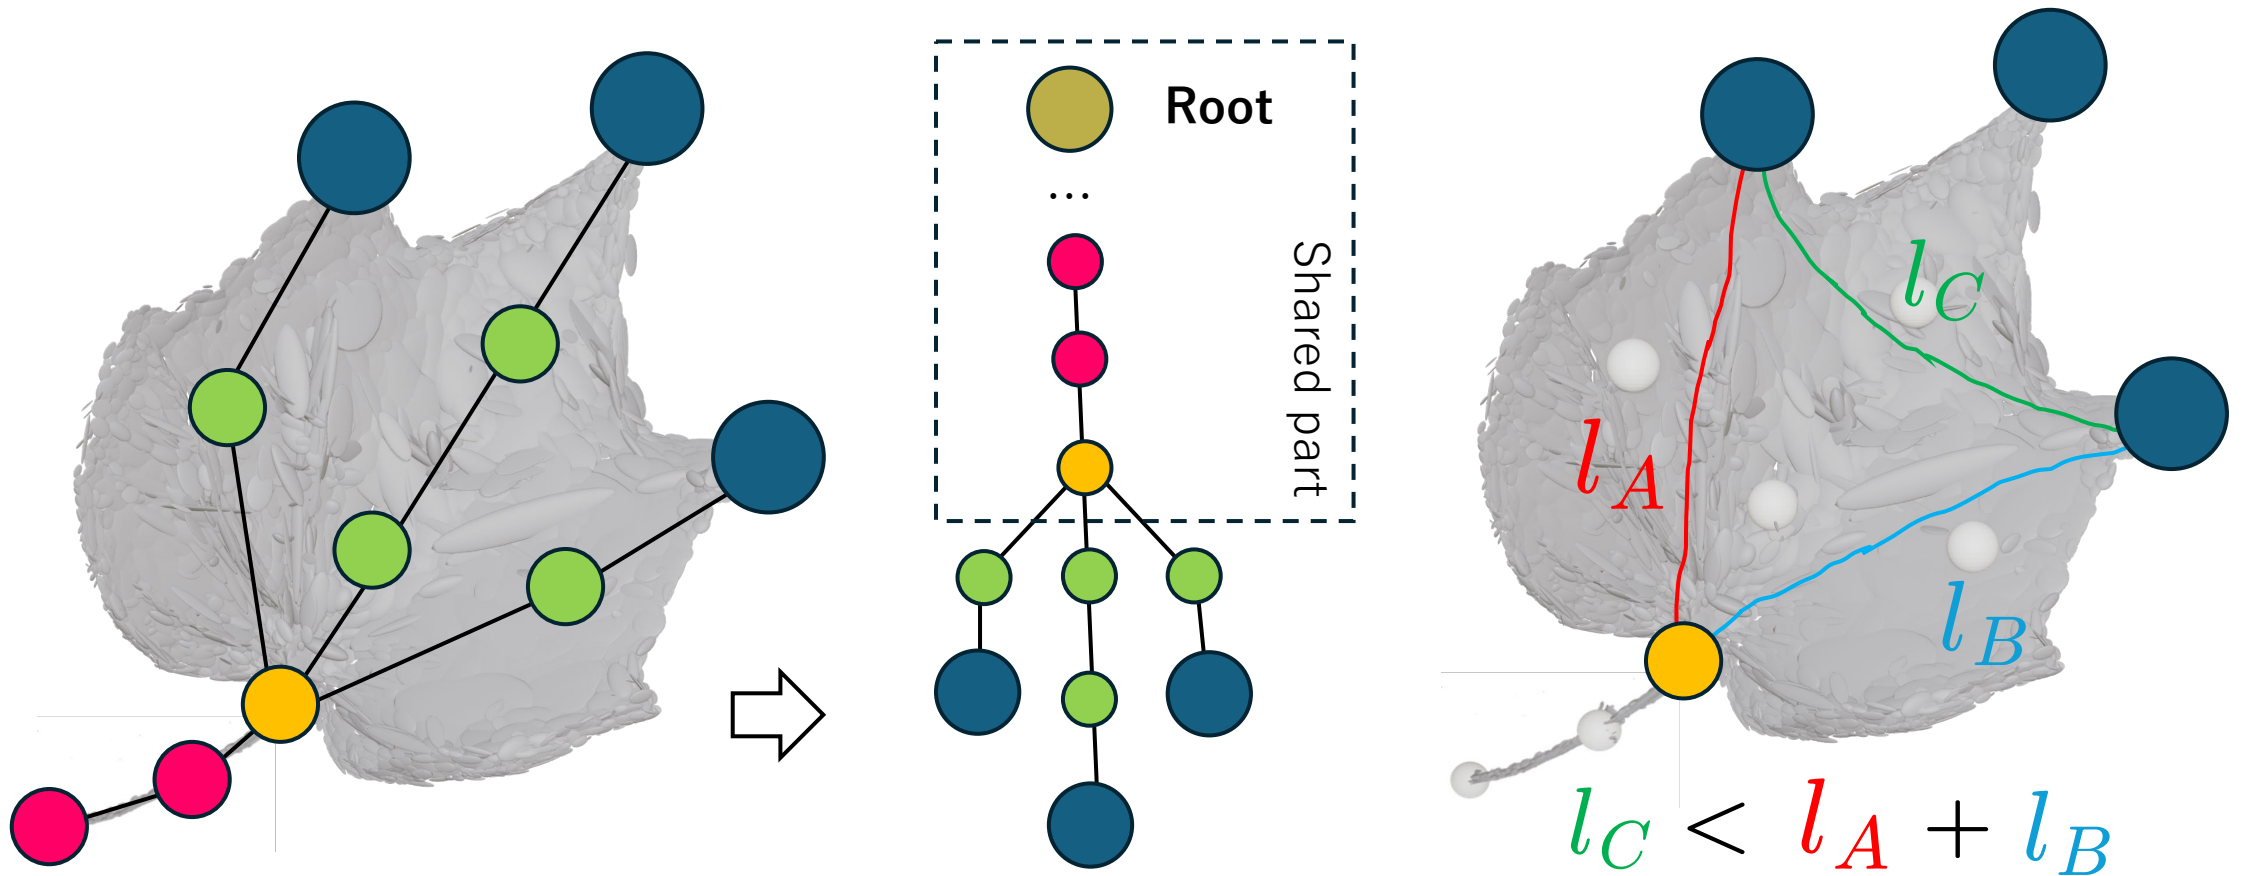

Radius is computed farthest distance from center (leaf points).

Leaf base has the smallest distance.

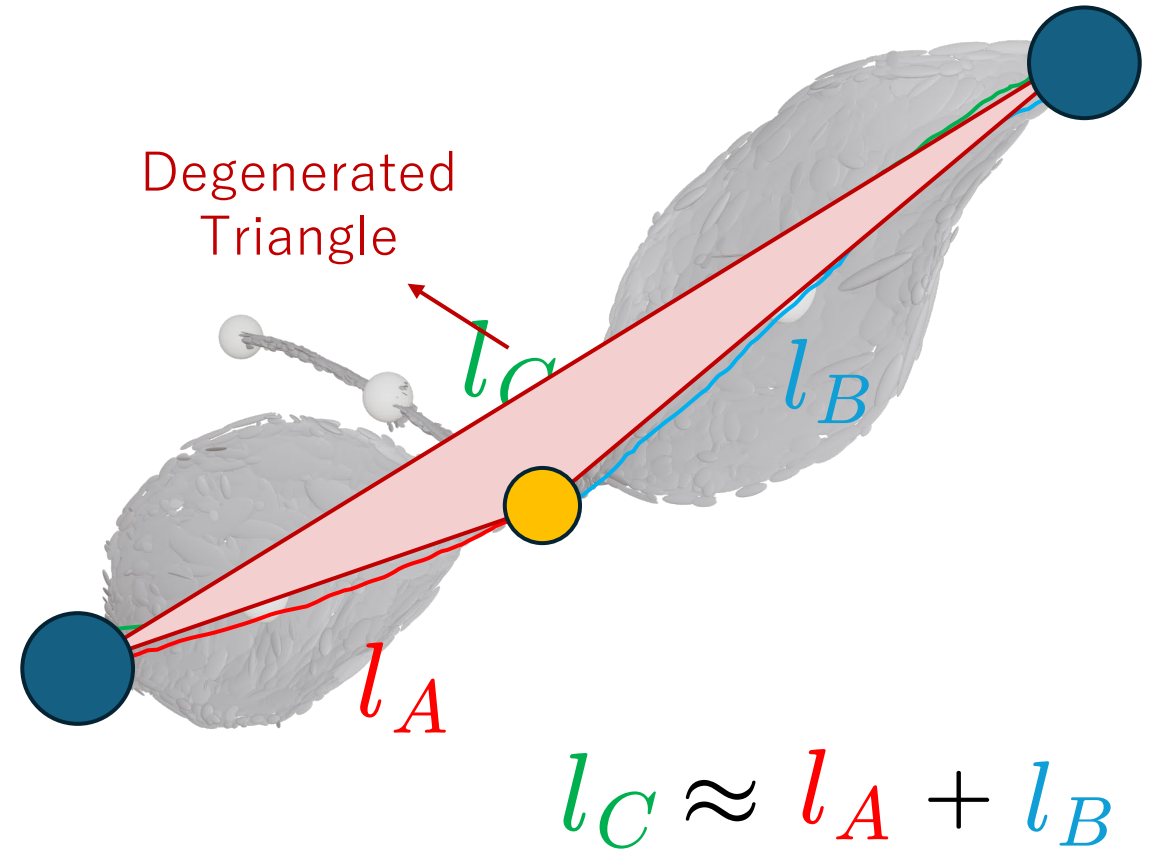

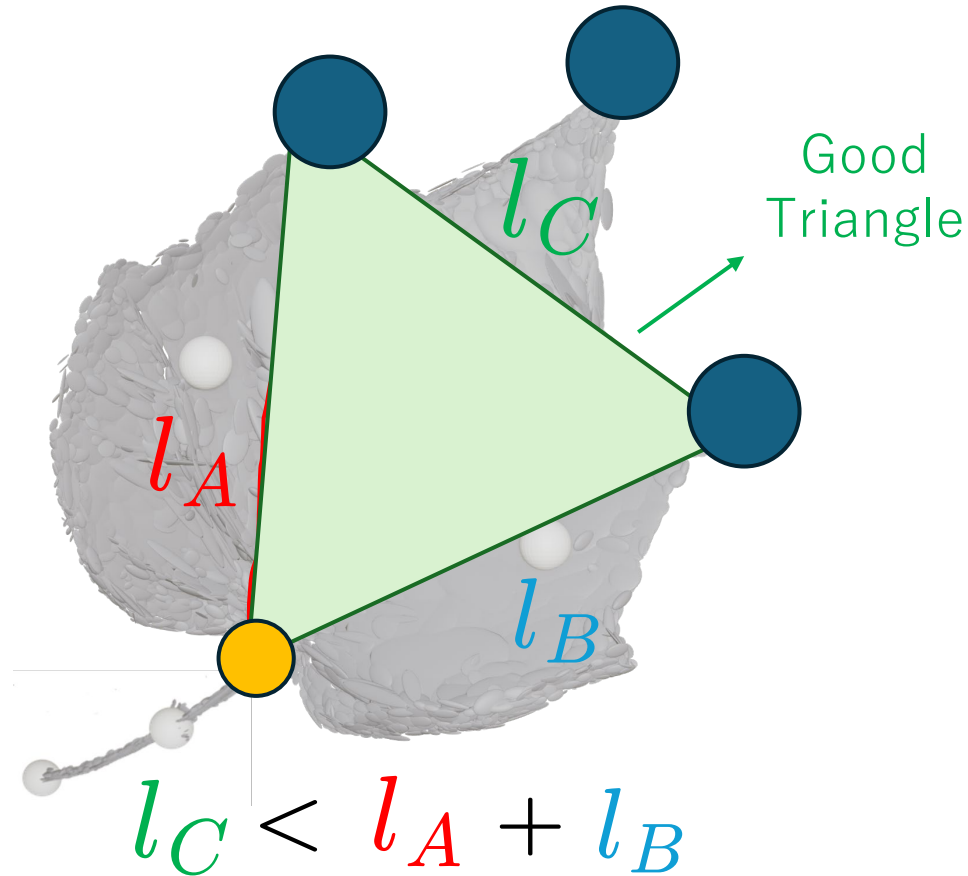

Tip Grouping for complicated leaves

- We group **tips** to where triangle inequality is unsatisfied.

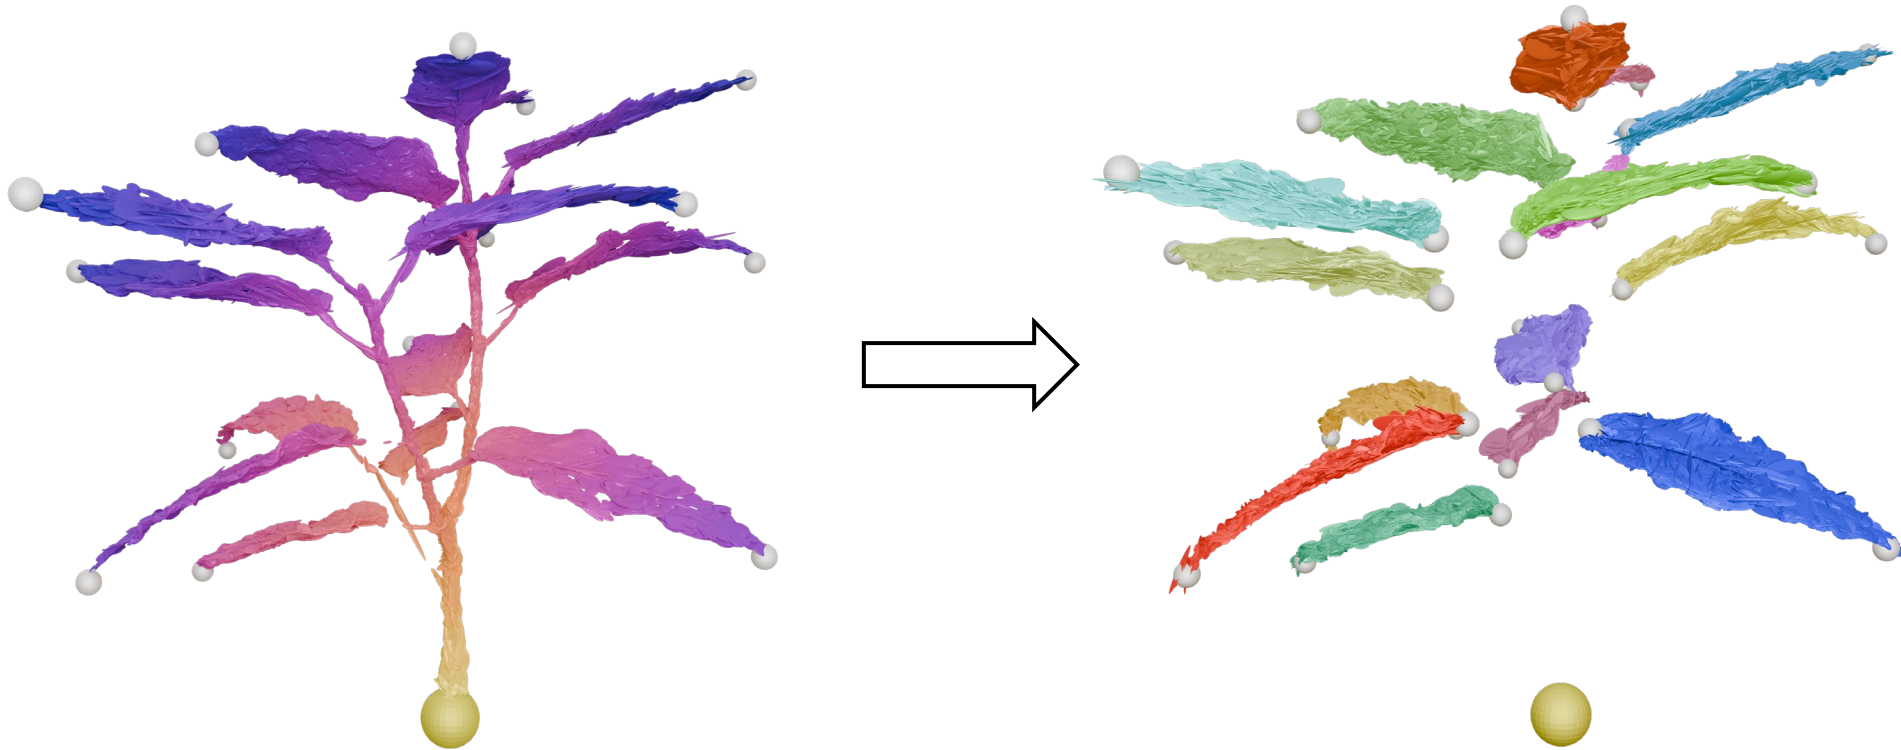

Tip Grouping for complicated leaves

Inequality of Triangle is used to group leaf tips.

Automatic Segmentation

Leaves are well segmented now.

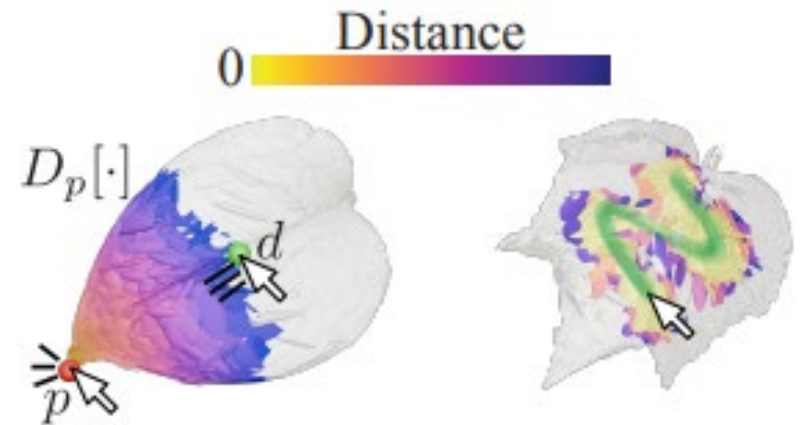

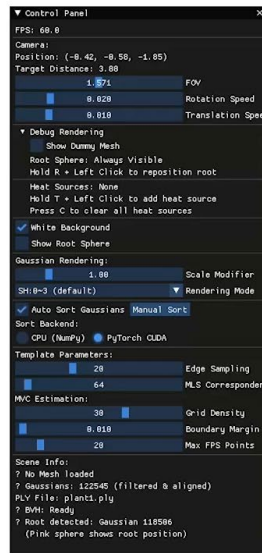

Manual Segmentation

Manual fallback is also possible.

Drag Tool

x8

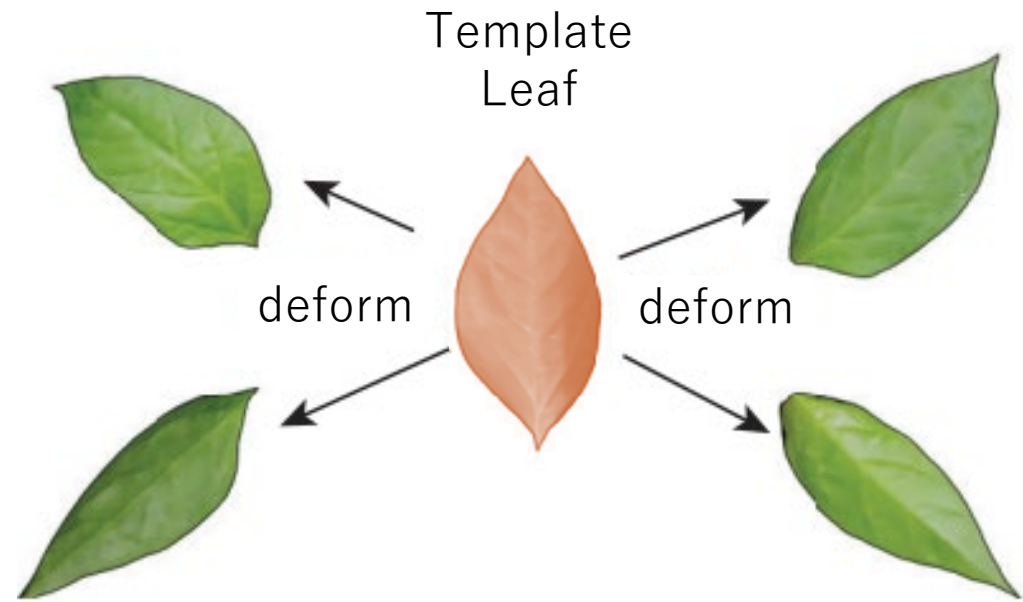

Drag

Brush

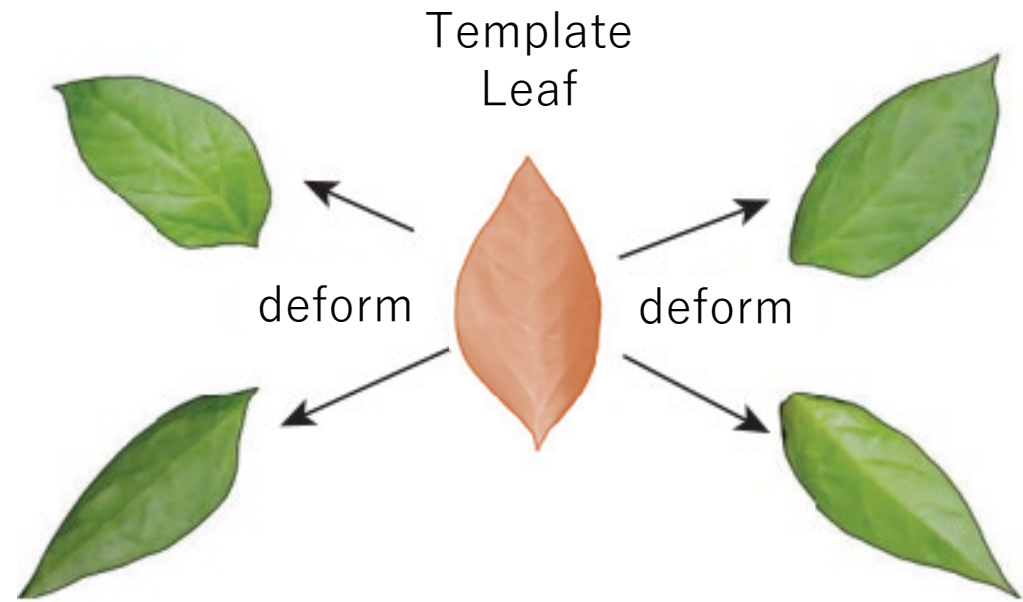

Compression using Similarity

Leaves are similar, take this inherent similarity to compress.

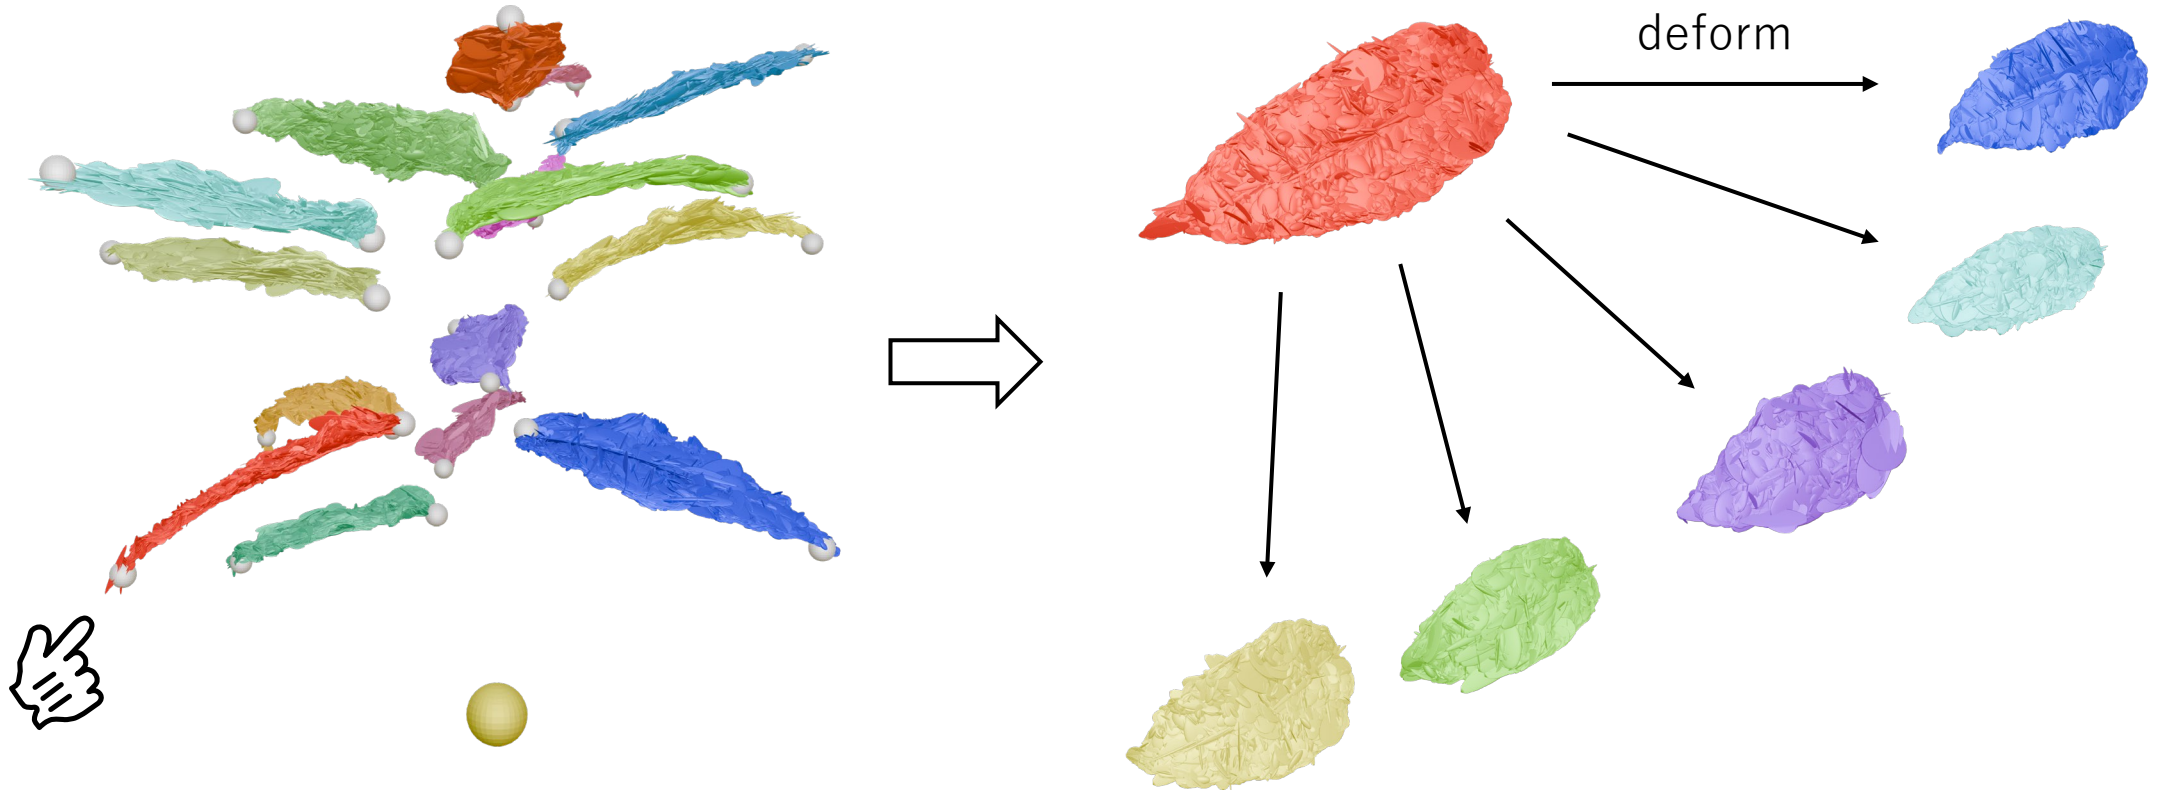

Compression using Similarity

Leaves are similar, take this inherent similarity to compress.

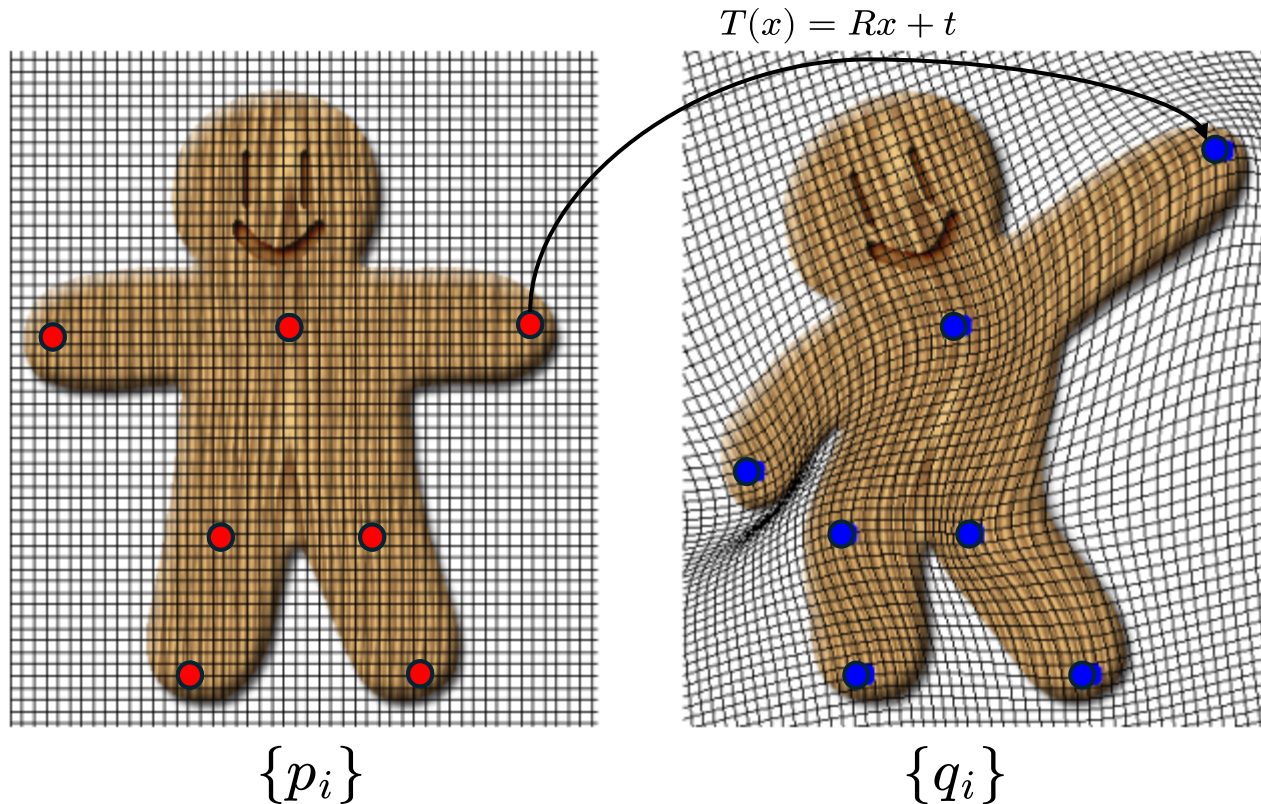

Similarity

Leaves are similar, take this inherent similarity to compress.

Moving Least Squares

Moving Least Squares [Schaefer+06] optimizes local transformation.

$$\sum_i w_i |T_i(p_i) - q_i|^2$$

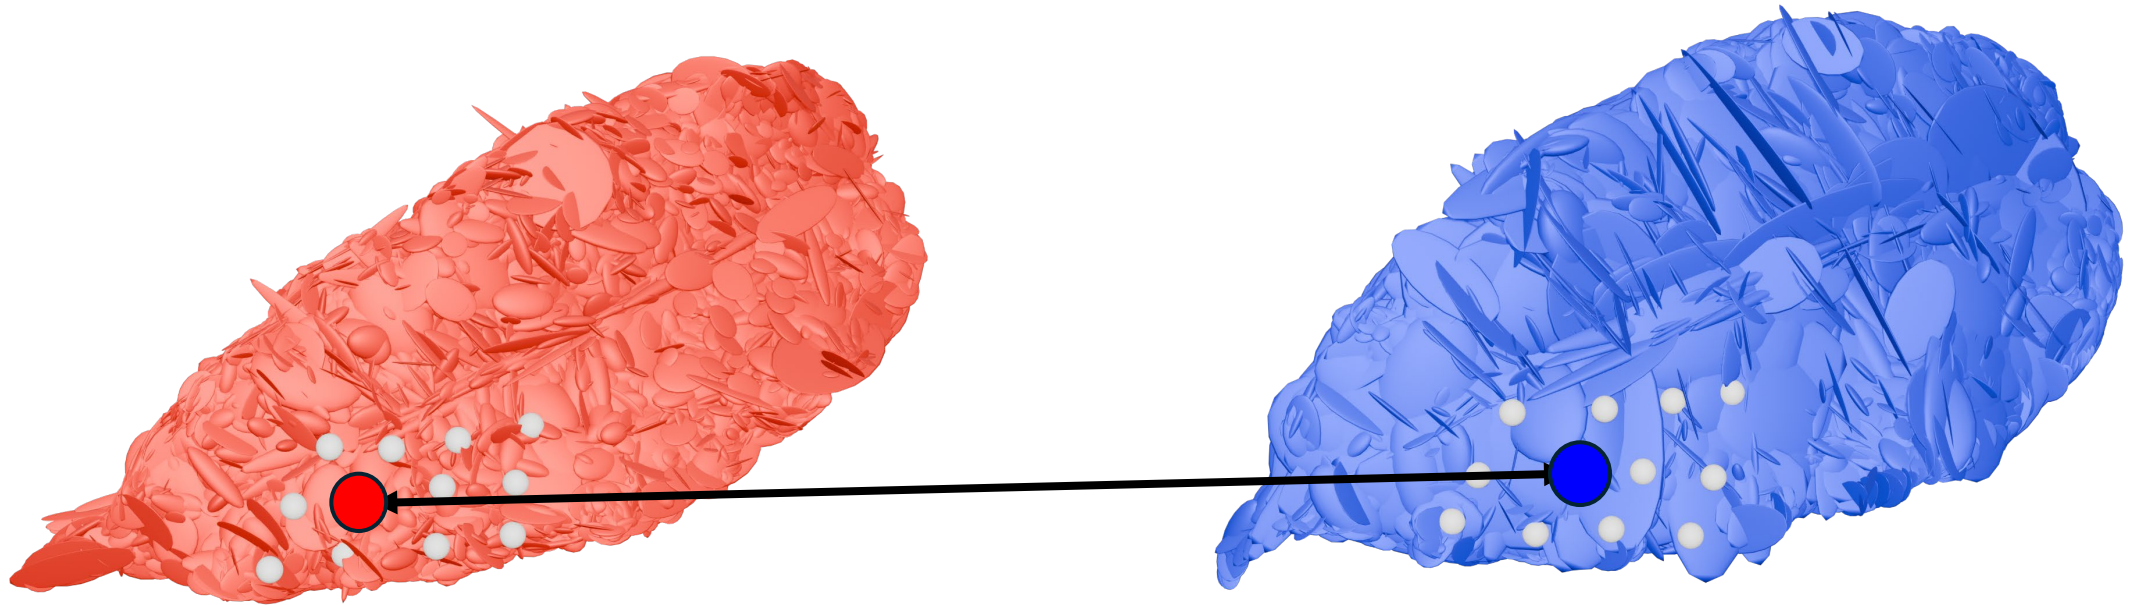

Kernel Function Local Rigid Transformation

$$\frac{1}{|p_i - v|^{2\alpha}}$$

$$T(x) = Rx + t$$

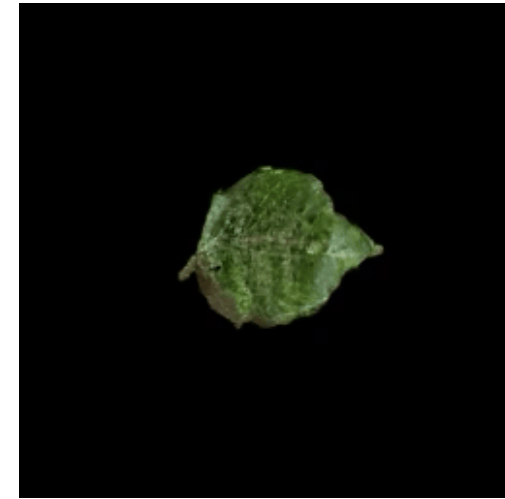

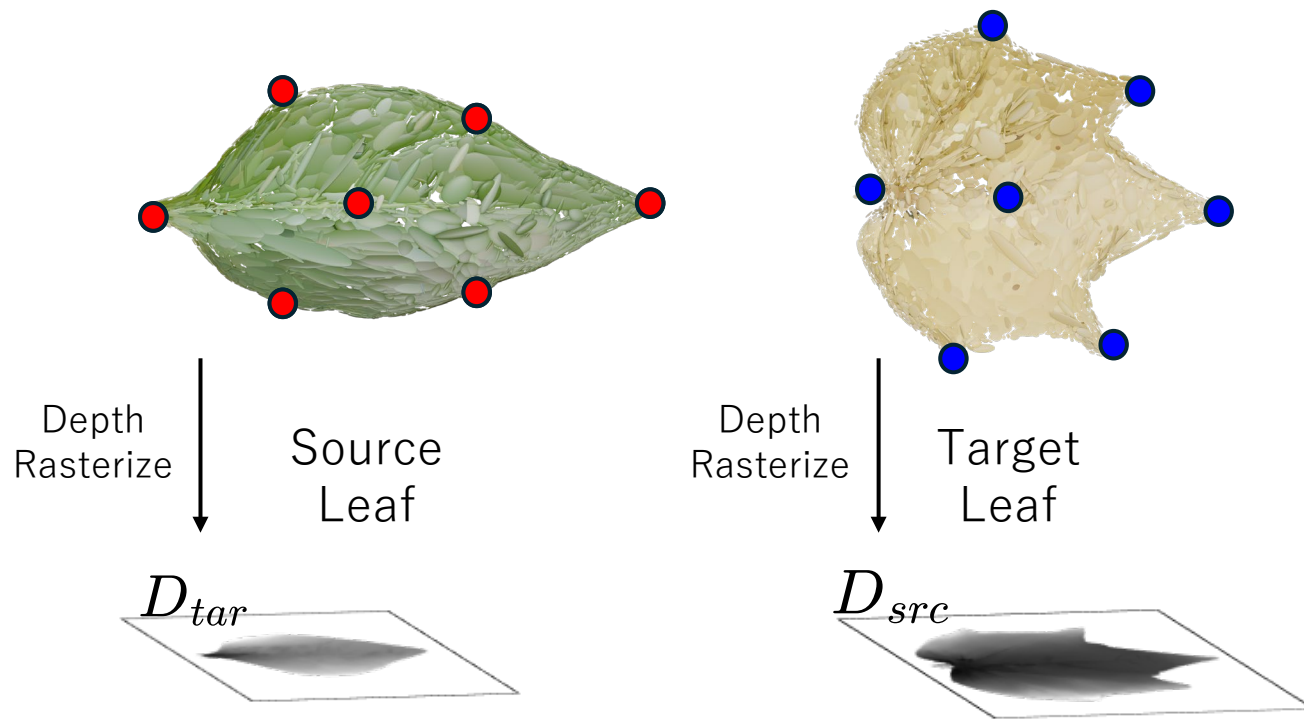

Initial Correspondence

- Align two leaves by PCA, build up initial correspondence.
- Farthest Point Sampling is applied to ensure uniform sampling.

Optimization

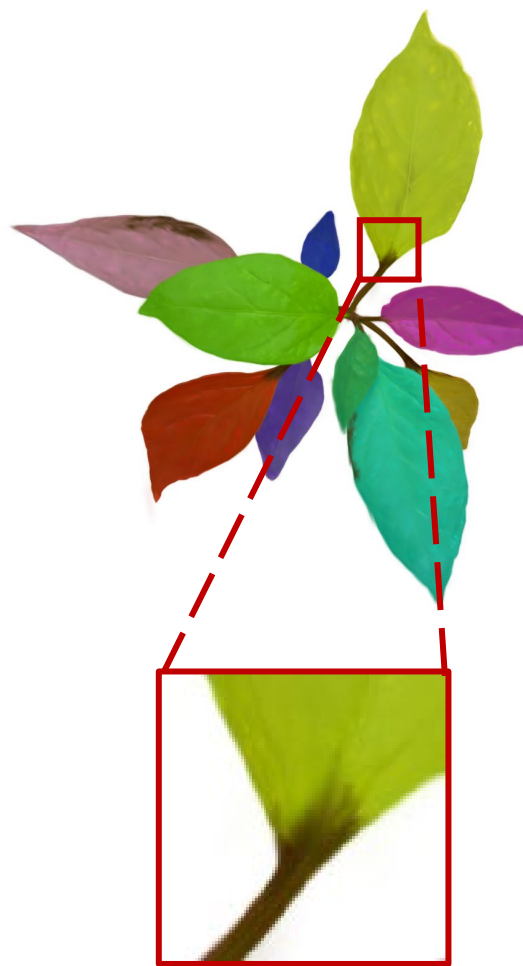

- Optimize correspondences with differentiable renderer.

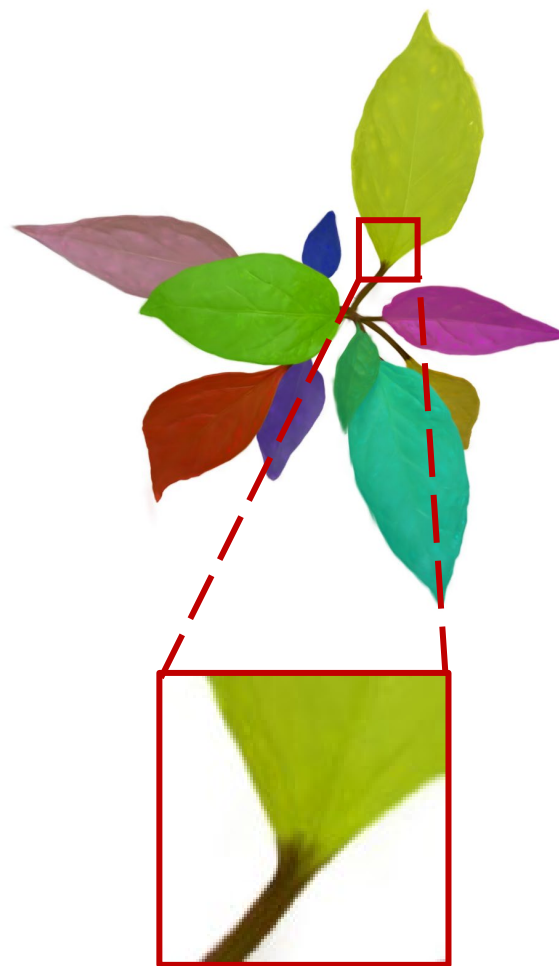

$$\mathcal{L}_{depth} = |D_{src} - D_{tar}|^2$$

$$\mathcal{L} = \mathcal{L}_{depth} + \lambda \mathcal{L}_{chamfer}$$
